Company Introduction

We are a customer focused company manufacturing Dental Instruments in accordance with the German Manufacturing techniques and knowledge. The production department is well equipped with the modern automated machines and tools which ensures the same quality of instruments constantly.

The implementation of advanced production and managements software throughout the production cycle ensures the delivery of instruments as per committed delivery time and keeps track of each production step.

The quality management system of the company is audited and certified by one of the world's top certification Bodies. In addition to thousands of general models, we are also developing customized models of instruments as per user requirements.

Selection of Material

German, French or Japanese steel (round or flat) is used in general models whereas Pakistan steel may be used in disposable items, The selection of material depends upon the choice of customers as per their quality, price and market requirements. Material certificate issued by a recognized lab can be provided with each lot.

Precision and Accuracy

Technical AutoCAD Drawings and Go/No Go Gauges are made through CNC machines which are used throughout the manufacturing cycle. This ensures the delivery of precise and accurate instruments, constantly and smoothly.

Production Process

Each production process is well defined and always documented under batch and lot numbers which can be tracked back as and when required within five years after production.

The files, grinding/polishing wheels, milling cutters, drills and threading taps are mostly imported from Germany to stay ahead in technological competition.

Special Surface Treatment

We have established a laboratory with all required testing chemicals and equipment.

All of the instruments are passed through boil test and then special surface treatment process to ensure smooth, clean and homogenous surface of the instruments. This process maximizes the natural corrosion resistance property of stainless steel.

Quality Control Department

We have established an independent quality control department which is equipped with the German testing equipments and well trained experienced staff. Each instrument is required to be passed through certain controlling processes before finally packed and shipped.

Our valued customers receive a Q.C Certificate with each lot that contains complete information about all Q.C parameters performed. This Certificate bears a Unique ID which can be used for traceability of all production processes from forging to packaging in our system and can be provided to customers as and when required.

Evaluate Explicitly

Unique Instrument For Estimating Cusp Thickness and Height For Evaluating The Need For Cusp Preparation When Performing Adhesive Restorations. Ideal For Evaluating The Strength Of The Natural Tooth Structure and Choosing The Restorative Technique To Be Used. If The Forked Instrument Tip Penetrates Up To Its Marks, The Tooth Structure Is Too Weak To Withhold Occlusal Forces With A Direct Restoration, And Other Clinical Options Must Be Considered.

Restorative Endodontic Explorers

The Micro Probe, Thanks to Its Long and Pointed Tip, Can Be Deeply Inserted Into The Endodontic Canal. It Gives s Better Visibility When Working With The Microscope. The Main Application Is The Identification of Access Into Root Canals and To Establish The Position and The Blocking Force of Broken Endodontic Instruments (as Well As Of Silver Pins) In Root Canals.

The Thin and Long Tips Bent At 60° Against The Handle Enable The Instruments To Be Introduced Deeply Into The Root Canal. The Total Length of The Tips Is 20mm With A Diameter of 0.8mm.

The Forceps Have Been Equipped With A Special Set of Serrated Edges Positioned At An Acute Angle, Which Enables A Firm Seizing of A Broken Instrument, Or A Silver Pin In The Root Canal. The Total Length Of The Serrated Working Part Is 5mm

The Internal Pin Prevents The Side Slipping Of The Tips.

The Insertion Of The New Medimpla Root Elevators Into The Intraligamental Zone Is Easier Thanks To The Extreme Sharpness and Perfect Bending Of The Tip. These Elevators Have Been Conceived To Perform A Minimum Traumatic Extraction And Therefore To Preserve The Alveolar Site In Perfect Conditions. The Special "pen Form" Assures Very Delicate Movements. All The Tips Are In Stainless Steel and Blue Titanium Coated.

Extraction forceps are divided in two main categories, upper extracting forceps and lower extracting forceps, which also divide in their turn in upper extraction forceps for the left and right quadrants and the lower extraction forceps for the left and right quadrants also.

The angulations of the forceps gives them the precision and easy access to the teeth, making a good grip for all diameters and crown shapes of the teeth that need to be extracted, depending on the section of the mouth they are situated in. The more distal teeth require bigger angulations while the frontal teeth are straighter for the maxillary teeth and having a 90 degree angle for the mandibular teeth.

The beak of the forceps which has a perpendicular axis on the handles is the main criteria of the upper extraction forceps while the beak that faces a longitudinal axis with the handles is the criteria for the lower extraction forceps.

Extraction Forceps For Lower Wisdom Teeth

Both Forceps Are Specifically Projected For The Extraction Of Lower Wisdom Teeth. Their Special Shape Allows An Easy And Safe Extraction Even When The Patient Is Unable To Fully Open The Mouth. The Forceps Must Be Positioned Between Tooth # 7 and # 8. After Checking If The Dental Arch Is Complete Evaluate If Tooth # 7 Is Healthy As It Is Often Decayed. Squeeze The Handles Of The Forceps While Tilting Them Simultaneously, The Tooth #8 Will Be Levered Out Presenting The Root In The Distal Position (as You Will Be Able To Verify Through An X-ray Image).

Needle Holders, Also Known As A Needle Drivers. They Are Used In Wound Closure, Ligation, Reanastomosis and Other Surgical Procedures Which Require Suturing. The Needle Is Usually Held In Position By A Clamp Mechanism, Which Allows The Operator To Manipulate The Needle Through Various Tissues. The Jaws Are Generally Textured And Short In Comparison To The Shank To Retain A Solid Grasp On The Needle.

Bone Scraper Is An Ideal Tool For Quick And Easy Harvesting Autologous Bone Material. It Is Used For Scraping, Collection And Transplantation Of Autologous Bone. Saws, And Trephine Bone Filters Are No Longer Necessary. During Scraping, The Bone Is Collected In A Chamber, And Simultaneously Mixed With The Blood. The Bone Material Can Be Implanted Directly, Often The Collected Bone Material Is Mixed With Bone Grafting And Bone Graft Material To Use Their Osteoinductive Effect.
